## Introduction to control theory.

$$\begin{cases} \frac{dx}{dt} = f(x, \boldsymbol{u}), & t \in (0, T) \\ x(0) = x_0 \end{cases}$$
(1)

where, at time t,

▶ 
$$x(t) \in \mathbb{R}^n$$
: state of this system,

•  $u(t) \in \mathbb{R}$ : control.

## Introduction to control theory.

$$\begin{cases} \frac{dx}{dt} = f(x, u), \quad t \in (0, T) \\ x(0) = x_0 \end{cases}$$
(1)

where, at time t,

• 
$$x(t) \in \mathbb{R}^n$$
: state of this system,

▶  $u(t) \in \mathbb{R}$ : control.

#### Definition

The system is said to be **controllable** at time T if for all initial conditions  $x_0 \in \mathbb{R}^n$ , for all targets  $x_f \in \mathbb{R}^n$ , there exists a control  $u \in L^{\infty}(0, T)$  such that  $x(T) = x_f$  where x is the solution of (2)

## Introduction to control theory.

$$\begin{cases} \frac{dx}{dt} = f(x, \boldsymbol{u}), & t \in (0, T) \\ x(0) = x_0 \end{cases}$$
(2)

where, at time t,

- ▶  $x(t) \in \mathbb{R}^n$ : state of this system,
- ▶  $u(t) \in \mathbb{R}$ : control.

### Definition (E-STLC)

Let  $(E_T, \|\cdot\|_{E_T})$  be a family of normed vector spaces of scalar functions defined on [0, T] for T > 0. The system is said to be **Econtrollable** at time T if for all  $\varepsilon > 0$ , for all initial conditions  $x_0 \in \mathbb{R}^n$ , for all targets  $x_f \in \mathbb{R}^n$ , there exists a control  $u \in E_T$  with  $\|u\|_{E_T} < \varepsilon$  such that  $x(T) = x_f$  where x is the solution of (2)

Example 1:

$$\begin{cases} \dot{x_1} = \boldsymbol{u}, \\ \dot{x_2} = x_1^2. \end{cases} \begin{cases} \dot{y_1} = \boldsymbol{u}, \\ \dot{y_2} = 0, \end{cases}$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Example 1:

$$\left\{ \begin{array}{ll} \dot{x_1} = \textit{\textbf{u}}, \\ \dot{x_2} = x_1^2. \end{array} \right. \left\{ \begin{array}{ll} \dot{y_1} = \textit{\textbf{u}}, \\ \dot{y_2} = \textit{\textbf{0}}, \end{array} \right.$$

Failure of the linearization principle:

for all control u,  $y_2(T) = y_0$ .

Example 1:

$$\left\{ \begin{array}{ll} \dot{x_1} = \textit{\textbf{u}}, \\ \dot{x_2} = x_1^2. \end{array} \right. \left\{ \begin{array}{ll} \dot{y_1} = \textit{\textbf{u}}, \\ \dot{y_2} = \textit{\textbf{0}}, \end{array} \right.$$

Failure of the linearization principle:

for all control u,  $y_2(T) = y_0$ .

$$x_2(T) = \int_0^T u_1(t)^2 dt \ge 0$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

 $\rightarrow$  no controllability for the nonlinear system.

Example 2:

$$\begin{cases} \dot{x_1} = u, \\ \dot{x_2} = x_1^3, \end{cases} \begin{cases} \dot{y_1} = u, \\ \dot{y_2} = 0, \end{cases}$$

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ● □ ● ● ●

Example 2:  

$$\begin{cases}
\dot{x_1} = u, \\
\dot{x_2} = x_1^3,
\end{cases}
\begin{cases}
\dot{y_1} = u, \\
\dot{y_2} = 0,
\end{cases}$$

Failure of the linearization principle:

for all control u,  $y_2(T) = y_0$ .

Example 2:  

$$\begin{cases}
\dot{x_1} = u, \\
\dot{x_2} = x_1^3,
\end{cases}
\begin{cases}
\dot{y_1} = u, \\
\dot{y_2} = 0,
\end{cases}$$

Failure of the linearization principle:

for all control u,  $y_2(T) = y_0$ .

For the nonlinear system:  $(x_1(T), x_2(T)) = (a, b)^T$  iff

$$\begin{cases} u_1(T) = a, \\ \int_0^T u_1(t)^3 dt = b, \end{cases}$$

 $\rightarrow$  controllability for the nonlinear system.

#### Example 3:

$$\begin{cases} \dot{x_1} = u, \\ \dot{x_2} = x_1, \\ \dot{x_3} = x_1^3 + x_2^2. \end{cases} \begin{cases} x_1 = u_1, \\ x_2 = u_2, \\ x_3(T) = \int_0^T (u_1(t)^3 + u_2(t)^2) dt. \end{cases}$$

(ロ)、(型)、(E)、(E)、(E)、(O)へ(C)

#### Example 3:

$$\begin{cases} \dot{x_1} = u, \\ \dot{x_2} = x_1, \\ \dot{x_3} = x_1^3 + x_2^2. \end{cases} \begin{cases} x_1 = u_1, \\ x_2 = u_2, \\ x_3(T) = \int_0^T (u_1(t)^3 + u_2(t)^2) dt. \end{cases}$$

**First option.** The quadratic term wins when  $||u'||_{L^{\infty}(0,T)}$  small

$$\int_0^T u_1^3(t) dt = -\int_0^T u_2(t) 2u(t) u_1(t) dt = \int_0^T u_2(t)^2 u'(t) dt$$

Then,

$$x_3(T) \ge (1 - ||u'||_{L^{\infty}(0,T)}) \int_0^T u_2(t)^2 dt$$
  
> 0

 $\rightarrow$  no controllability.

Second option. The cubic term wins for controls of the form:

$$u_{\lambda}(t) = \sqrt{\lambda} \phi''\left(rac{t}{\lambda}
ight)$$

Size of the control:

$$\|u_{\lambda}\|_{L^{\infty}(0,T)} \approx \sqrt{\lambda}, \quad \|u_{\lambda}'\|_{L^{\infty}(0,T)} \approx \frac{1}{\sqrt{\lambda}}.$$

Then,

$$\begin{aligned} x_3(T) &= \int_0^T u_1(t)^3 dt + \int_0^T u_2(t)^2 dt \\ &= \lambda^{\frac{11}{2}} \int_0^1 \phi'(\theta)^3 d\theta + \lambda^6 \int_0^1 \phi(\theta)^2 d\theta \\ &= a + o(a) \end{aligned}$$

with  $\int_0^1 \phi'(\theta)^3 d\theta = sign(a)$  and  $\lambda = |a|^{\frac{2}{11}}$ .  $\rightarrow$  controllability

Second option. The cubic term wins for controls of the form:

$$u_{\lambda}(t) = \lambda^{lpha} \phi''\left(rac{t}{\lambda}
ight).$$

Size of the control:

$$\|u_{\lambda}\|_{L^{\infty}(0,T)} \approx \lambda^{\alpha}, \quad \|u_{\lambda}'\|_{L^{\infty}(0,T)} \approx \lambda^{\alpha-1}.$$

Then,

$$\begin{aligned} x_3(T) &= \int_0^T u_1(t)^3 dt + \int_0^T u_2(t)^2 dt \\ &= \lambda^{3\alpha+4} \int_0^1 \phi'(\theta)^3 d\theta + \lambda^{2\alpha+5} \int_0^1 \phi(\theta)^2 d\theta \\ &= a + o(a) \end{aligned}$$

with  $\alpha < 1$ ,  $\int_0^1 \phi'(\theta)^3 d\theta = sign(a)$  and  $\lambda = |a|^{1/3\alpha+4}$ .  $\rightarrow$  controllability

Understand how the linearized test work

Bilinear control system

- the state:  $\psi$ , such that  $\|\psi(t)\|_{L^2(0,1)} = 1$  for all time,
- ▶  $\mu : (0,1) \rightarrow \mathbb{R}$  dipolar moment of the quantum particle
- ▶ and u:  $(0, T) \rightarrow \mathbb{R}$  denotes a scalar control.

### Question.

$$\begin{cases} i\partial_t \psi = -\partial_x^2 \psi - \boldsymbol{u}(t)\boldsymbol{\mu}(x)\psi, \quad (t,x) \in (0,T) \times (0,1), \\ \psi(t,0) = \psi(t,1) = 0, \quad t \in (0,T). \end{cases}$$
(3)

Definition (Small-time controllability around the ground state.) Let  $(E_T, \|\cdot\|_{E_T})$  be a family of normed vector spaces of scalar functions defined on [0, T], for T > 0. The system (3) is said to be **E-STLC around the ground state** if:

$$\exists s \in \mathbb{N}, \quad \forall T > 0, \quad \forall \varepsilon > 0, \quad \exists \delta > 0,$$
  
$$\forall \psi_f \in \mathcal{S}, \|\psi_f - \psi_1(T)\|_{H^s_{(0)}(0,1)} < \delta, \quad \exists u \in L^2(0,T) \cap E_T,$$
  
$$\|u\|_{E_T} < \varepsilon, \quad \psi(0) = \varphi_1, \quad \psi(T) = \psi_f.$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ▲ ●

## When the linear system is controllable.

$$i\partial_t\psi(t,x) = -\partial_x^2\psi(t,x) - u(t)\mu(x)\psi(t,x), \quad \psi(t,0) = \psi(t,1) = 0.$$

Theorem (Beauchard and Laurent, 2010) Let T > 0 and  $\mu \in H^3((0,1), \mathbb{R})$  be such that

$$\exists c > 0 \text{ such that }, \forall j \in \mathbb{N}^*, |\langle \mu \varphi_1, \varphi_j \rangle| \geq \frac{c}{j^3}.$$

Then, the system is controllable in  $S \cap H^3_{(0)}$ , locally around the ground state in arbitrary time T > 0 with controls in  $L^2((0, T), \mathbb{R})$ .

- Controllability of a linearized system : moment problem.
- Local controllability of the non-linear system : inverse mapping theorem to the end-point map.

## Moment method.

**First-order:**  $i\partial_t \Psi = -\partial_x^2 \Psi - u(t)\mu(x)\psi_1$ Explicit solution:

$$\Psi(T) = i \sum_{j=1}^{+\infty} \left( \langle \mu \varphi_1, \varphi_j \rangle \int_0^T \frac{u(t)e^{i(\lambda_j - \lambda_1)t}dt}{\varphi_j e^{-i\lambda_j T}}, \quad t \in (0, T). \right)$$

▶ If 
$$\langle \mu \varphi_1, \varphi_K \rangle = 0$$
, then

 $\langle \Psi(t), \varphi_K \rangle \equiv 0.$ 

▶ If for all  $j \in \mathbb{N}^*$ ,  $\langle \mu \varphi_1, \varphi_j \rangle \neq 0$ , the equality  $\Psi(T) = \psi_f$  is equivalent to

$$\int_0^T u(t) e^{i(\lambda_j - \lambda_1)t} dt = -i \frac{\langle \psi_f, \varphi_j \rangle}{\langle \mu \varphi_1, \varphi_j \rangle} e^{i\lambda_j T}, \quad \forall j \in \mathbb{N}^*$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

#### Theorem (The *n*-th quadratic obstruction.)

Let  $n \in \mathbb{N}$  and  $\mu \in H^{2n+1}((0,1),\mathbb{R})$  satisfying  $\langle \mu \varphi_1, \varphi_K \rangle = 0$  for some  $K \in \mathbb{N}^* + (Hyp)_n$ . The Schrödinger equation is not  $H^{2n-3}$ -STLC.

More precisely, there exists a time  $T^* > 0$  such that for any final time  $T \in (0, T)$ , there exists a bound  $\eta > 0$  such that for all controls  $u \in H^{2n-3}(0, T)$  with  $||u||_{H^{2n-3}(0,T)} \leq \eta$ , if the solution  $\psi$ of Schrödinger with initial data  $\varphi_1$  satisfied

$$\langle \psi(T), \varphi_{j_p} \rangle = 0$$
 for  $j_1, \dots, j_n$  s.t.  $\langle \mu \varphi_1, \varphi_{j_p} \rangle \neq 0$ 

then

$$\operatorname{Im}\left(\langle\psi(T),\varphi_{K}e^{-i\lambda_{1}T}\rangle\right) \geq \alpha_{K}^{n}\int_{0}^{T}u_{n}(t)^{2}dt \quad \text{with } \alpha_{K}^{n} > 0$$

#### Theorem (The *n*-th quadratic obstruction.)

Let  $n \in \mathbb{N}$  and  $\mu \in H^{2n+1}((0,1),\mathbb{R})$  satisfying  $\langle \mu \varphi_1, \varphi_K \rangle = 0$  for some  $K \in \mathbb{N}^* + (Hyp)_n$ . The Schrödinger equation is not  $H^{2n-3}$ -STLC.

More precisely, there exists a time  $T^* > 0$  such that for any final time  $T \in (0, T)$ , there exists a bound  $\eta > 0$  such that for all controls  $u \in H^{2n-3}(0, T)$  with  $||u||_{H^{2n-3}(0,T)} \leq \eta$ , if the solution  $\psi$ of Schrödinger with initial data  $\varphi_1$  satisfied

$$\langle \psi(T), \varphi_{j_p} \rangle = 0$$
 for  $j_1, \dots, j_n$  s.t.  $\langle \mu \varphi_1, \varphi_{j_p} \rangle \neq 0$ 

then

$$\operatorname{Im}\left(\langle \psi(T), \varphi_{K} e^{-i\lambda_{1}T} \rangle\right) \geq \alpha_{K}^{n} \int_{0}^{T} u_{n}(t)^{2} dt \quad \text{with } \alpha_{K}^{n} > 0$$

with  $\alpha_{K}^{n} \approx \langle \underbrace{\left[\left[f_{0}, \left[f_{0}, \dots, \left[f_{0}, f_{1}\right]\right]\right]}_{\text{length } (n,1)}, \underbrace{\left[f_{0}, \left[f_{0}, \left[f_{0}, \dots, \left[f_{0}, f_{1}\right]\right]\right]}_{\text{length } (n+1,1)}\right] (\varphi_{1}), \varphi_{K} \rangle.$ 

# Idea of proof

Power series expansion:  $\psi \approx \psi_1 + \Psi + \xi$ .

Linear term:

$$\langle \Psi(T), \varphi_K 
angle = 0.$$

Quadratic term:

$$\operatorname{Im}\langle\xi(T),\varphi_{K}\rangle\geq 2\alpha_{K}^{n}\int_{0}^{T}u_{n}(t)^{2}dt.$$

Remainder:

$$\langle (\psi - \psi_1 - \Psi - \xi) (T), \varphi_K \rangle = O \left( \|u_1\|_{L^2(0,T)}^3 \right)$$
$$= o \left( \int_0^T u_n(t)^2 dt \right)$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

when  $||u||_{H^{2n-3}(0,T)} \to 0.$ 

- The system is not  $H^{2n-3}$ -STLC.
- What happen for controls less regular ? Can the cubic term prevails on the quadratic term and thus allows to gain back controllability lost at the linear level, despite a drift ?

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Conjecture: the system is  $H^{2n-4}$ -STLC.

## Toward a positive result

- On Span( $\varphi_{\mathcal{K}}$ ), **no controllability** at the linear level.
- On H = Span(φ<sub>K</sub>)<sup>⊥</sup>, controllability at the linear level and thus at the non linear level.

Step 1: On  $[0, T_1]$ , long  $\varphi_K$ ,

$$\langle \psi(\mathsf{T}_1), \varphi_{\mathsf{K}} 
angle = \langle \psi_{\mathsf{f}}, \varphi_{\mathsf{K}} 
angle + o(\psi_{\mathsf{f}}),$$

Step 2: On  $[T_1, T_2]$ , on H,

$$\mathbb{P}_H\psi(T_2)=\mathbb{P}_H\psi_f.$$

It remains to prove that

$$\langle \psi(T_2), \varphi_K \rangle - \langle \psi(T_1), \varphi_K \rangle = o(\psi_f).$$

 $\rightarrow$  need simultaneous estimates on the control.
